Course Information

Many people and organisations always use spreadsheet applications to handle various data visualisation tasks. Google Sheets and Microsoft Excel are among today's most popular and useful programs. This course explains how to use Microsoft Excel to boost productivity. We begin with the basics such as installing and starting up Excel, saving a workbook and changing preferences and formatting elements to suit your needs.

We then examine the use of formulas and comparison operators in Excel. Some people find it difficult to work with Excel so this course uses simple terms to explain how to perform each function step by step. We demonstrate how to print a workbook and manage your passwords in Excel. We then go through the use of important advanced spreadsheet features like 'IF' functions.

This Excel tutorial provides a strong understanding of the program and the skills that make you a spreadsheet expert. These data visualisation skills can also be applied with Google Sheets and boost your professional value in most career fields. Most white collar jobs require some familiarity with spreadsheets so sign up for this MS Excel tutorial to become the office expert with invaluable skills.

Modules Studied

Module 1: Microsoft Excel Basics

Module 2: Advanced Excel Functions and Features

Module 3: Course assessment
